Reflection seismology (or seismic reflection) is a method of exploration geophysics that uses the principles of seismology to estimate the properties of the Earth's subsurface from reflected seismic waves. The method requires a controlled seismic source of energy, such as dynamite or Tovex blast, a specialized air gun or a seismic vibrator, commonly known by the trademark name Vibroseis.

The moment magnitude scale (MMS; denoted as M_w or M) is one of many seismic magnitude scales used to measure the size of earthquakes.. The scale was developed in the 1970s to succeed the 1930s-era Richter magnitude scale (M_L). Even though the formulas are different, the new scale was designed to produce magnitude values for a given earthquake similar to those produced by the older one.

Canadian Science Publishing (CSP) is an independent, not-for-profit publisher of 24 international science and engineering journals. While we support Open Access (OA), as evidenced by the 3 OA journals and 21 hybrid journals that we publish, and we appreciate the goal of cOAlition S to make publicly funded research freely accessible, we have concerns about the viability of the proposed Plan S ...
