A systematic assessment of the ability of two selected 1-D lake models (the model of S.W. Hostetler and the Freshwater Lake model) to simulate lake surface temperature and fluxes for different lake conditions, corresponding to typical temperate freezing lakes of North America, through a set of offline tests, is presented.

snowmelt in locations upstream or elsewhere in the watershed also affect the length of time a lake is frozen. Thus, ice formation and breakup dates are key indicators of climate change. If lakes remain frozen for longer periods, it can signify that the climate is cooling. Conversely, shorter periods of ice cover suggest a warming climate.

probability of Cayuga Lake's freezing over in a given year. Using his complicated formula, the mathematician came up with a probability of 2% for Cayuga Lake's completely freezing over in any given year. 6 This writer is not aware of any such mathematician's attempt to determine the probability of Seneca Lake's freezing over.
