In physics (specifically, in kinetic theory) the Einstein relation (also known as Einstein–Smoluchowski relation) is a previously unexpected connection revealed independently by William Sutherland in 1904, Albert Einstein in 1905, and by Marian Smoluchowski in 1906 in their papers on Brownian motion. The more general form of the equation is $\mu = D \frac{v}{k_B T}$ where D is the diffusion constant;

If a body's speed is a significant fraction of the speed of light, it is necessary to use relativistic mechanics to calculate its kinetic energy. In special relativity theory, the expression for linear momentum is modified.. With m being an object's rest mass, v and \hat{v} its velocity and speed, and c the speed of light in vacuum, we use the expression for linear momentum $\vec{p} = \gamma m \hat{v}$, where $\gamma = \frac{1}{\sqrt{1 - \hat{v}^2/c^2}}$.

The reason that O_2 , despite a larger MW 32, has a smaller diameter than N_2 MW 28, lies in the electronic structure of the molecules. As indicated by quantum mechanical theory of molecules, the electrons of a molecule form a diffuse

Seeing old friends in a new light: A divergent synthesis of quinine and quinidine (see structures) was designed on the basis of a symmetrical and nonstereogenic intermediate, conceptually different from the stereodefined piperidine precursors used in past syntheses. Complementary late-stage local-desymmetrization reactions were developed to access the two targets.
